## On-Chip UVEPROM 4-Bit Single-Chip Microcontroller

### Preliminary

### Overview

The LC65E1104 is an on-chip UVEPROM version of Sanyo's LC651104N/F/L and LC651102N/F/L CMOS 4-bit single-chip microcontrollers. The LC65E1104 has the same functions and pin assignment as the LC651104N/F/L and LC651102N/F/L mask ROM products, although the A/D characteristics and certain other characteristics differ somewhat. It includes a 4-KB on-chip EPROM.

The LC65E1104 is provided in DIC30S and MFC30S window packages and is ideal for program development and evaluation since program data can be rewritten multiple times.

### Features

- EPROM data option switching

The following four LC65E1104 functions can be specified by EPROM data:

- Port C and D output levels at reset
- Clock oscillator option
- Clock predivider option
- Watchdog reset option

However, note that the port output circuit type cannot be changed. These circuits are always open-drain outputs.

- Internal UVEPROM capacity: 4096 bytes
- The LC65E1104 on-chip UVEPROM can be programmed and verified using a general-purpose EPROM programmer.

Sanyo provides special-purpose 30-to-28-pin adapters (the W65EP1104D for the DIC package and the W65EP1104M for the MFC package) to allow commercial EPROM programmers to be used with the LC65E1104.

- Data security function
- Pin compatible with the LC651104/1102 mask ROM devices
- Instruction cycle time: 0.92  $\mu$ s to 20  $\mu$ s (A/D converter cycle time: 0.98  $\mu$ s to 12  $\mu$ s)
- Factory shipment: DIC-30S (with window), MFC-30S (with window)

### Usage Notes

The LC65E1104 was designed for developing and evaluating programs for the LC651104/1102 series microcontrollers. Keep the following points in mind when using the LC65E1104.

- Protecting EPROM data from UV exposure  
Keep the LC65E1104's package window covered with an opaque seal when using the device.
- The LC65E1104 differs from the LC651104N/F/L and LC651102N/F/L as listed in the table below.

Item	LC65E1104	LC651104F/1102F	LC651104N/1102N	LC651104L/1102L
I/O circuit configuration	Open drain (N channel)	Open drain or pull-up resistor-provided output selectable bit by bit (user mask option)		
Port C and D output levels at reset	High or low selected in 4-bit units (by EPROM data)	High or low selected in 4-bit units (user mask option)		
Oscillator	Resonator	RC/ceramic (by EPROM data)	RC/ceramic (user mask option)	
	Predivider option	1/1, 1/3, 1/4 (by EPROM data)	1/1 only (user mask option)	1/1, 1/3, 1/4 (user mask option)
Watchdog reset	Available/not available (by EPROM data)	Available/not available (user mask option)		
Operating supply voltage range ( $V_{DD}$ )	3.0 to 6.0 V*	4.0 to 6.0 V	3.0 to 6.0 V	2.5 to 6.0 V
Normal mode current drain	Mask version + about 3 mA (typical)	2 mA (typical)	1.5 mA (typical)	1.5 mA (typical)
Low-level input current (RES terminal)	-50 $\mu$ A (typical)	-10 $\mu$ A (typical)		
Operating temperature range	+10 to +40°C	-40 to +85°C		
Package	DIC30S (with window) MFC30S (with window)	DIP30S, DIP30S-D MFP30S		

Note: A/D converter operating supply voltage range: 4.7 to 5.3 V

### Oscillator circuit option

Option	Circuit	Conditions and notes
1. External clock		Leave the OSC2 pin open.
2. 2-pin RC OSC		
3. Ceramic oscillator		

### Predivider option

Option	Circuit	Conditions and notes
1. No predivider (1/1)		<ul style="list-style-type: none"> <li>Applicable to all 3 oscillator options.</li> <li>The oscillator or external clock frequency must not exceed 1444 kHz. (LC651104N, LC651102N)</li> <li>The oscillator or external clock frequency must not exceed 4330 kHz. (LC651104F, LC651102F)</li> <li>The oscillator or external clock frequency must not exceed 1040 kHz. (LC651104L, LC651102L)</li> </ul>

3. 1/4 predivider		<ul style="list-style-type: none"> <li>Applicable to the external clock and ceramic oscillator options.</li> <li>The oscillator or external clock frequency must not exceed 4330 kHz.</li> </ul>

Note: The oscillator and predivider options are summarized in the LC651104/1102 semiconductor news.

### Port C and D reset output level options

Either of the following two options may be selected for the C and D I/O ports. Note that these options are specified in 4-bit units.

Option name	Conditions
1. Output at reset: high	All 4 bits of the selected port(s) (C or D or both)
1. Output at reset: low	All 4 bits of the selected port(s) (C or D or both)

### Port output configuration option

All shared-function I/O ports have an open-drain output circuit in the LC65E1104.

Option	Circuit	Conditions and notes
1. Open drain output		Ports A, C, D, E and F

### Watchdog reset option

This option specifies the use of the PE1/WDR pin. This pin can be specified to function either as the normal port PE1 or as the WDR watchdog reset pin.

### Usage Notes

#### 1. Option specification

The SU60K.EXE program is used for option specification. The option code for the option specification area (addresses 1000 to 100A (hexadecimal)) is created by assembling the output of the SU60K.EXE program using the Sanyo M60K.EXE macro assembler and then linking the macro assembler output with the Sanyo L60K.EXE linker. It is also possible to load data directly into the option specification area. Specify options according to the option code creation table on page 8.

#### 2. PROM programming

LC65E1104 can be programmed with a general-purpose EPROM programmer using either the W65EP1104D or W65EP1104M adapter.

- Recommended EPROM programmers

Manufacturer	EPROM programmer
Advantest	R4945, R4944, R4943 or equivalent programmer
Ando	AF-9704
AVAL	—
Minato electronics	—

- The Intel 27512 (VPP: 12.5 V) high-speed programming method must be used to program this device. The address range must be set to 0 to 100A (hexadecimal) and the DASEC jumper must be set to the off position.

#### 3. Using the data security function

The data security function prevents data already written to the microcontroller's PROM from being overwritten.

LC651104 data security function procedure

- Move the DASEC jumper on the EPROM programming pin adapter to the on position. This enables the data security function.
- Attempt to reprogram the EPROM.

Since the data security function is enabled, the EPROM programmer will display an error. Note that this error is not due to an error in either the programmer or the LSI.

## LC65E1104

- Note:
1. At step 2, the data security function will not operate if all the data at the addresses to be programmed have the value FF (hexadecimal).
  2. At step 2, the data security function will not apply to (i.e., will not prevent) programming using the sequence BLANK Æ PROGRAM Æ VERIFY.
  3. Return the jumper to the off position after executing the data security function.
